

StairCon

ERP – Connection

This StairCon[®] add-on module enables a connection between a company's ERP-system and StairCon[®]. Data can be transferred between the systems. It makes the process of handling orders more effective within the company and the risk for errors decreases.

The connection from StairCon[®] can be made to almost any kind of ERP-system. Customization depends on the actual ERP-system. The functionality of the connection is specified in a configuration file. An input string can be configured. For this example the input string can be "our project number".

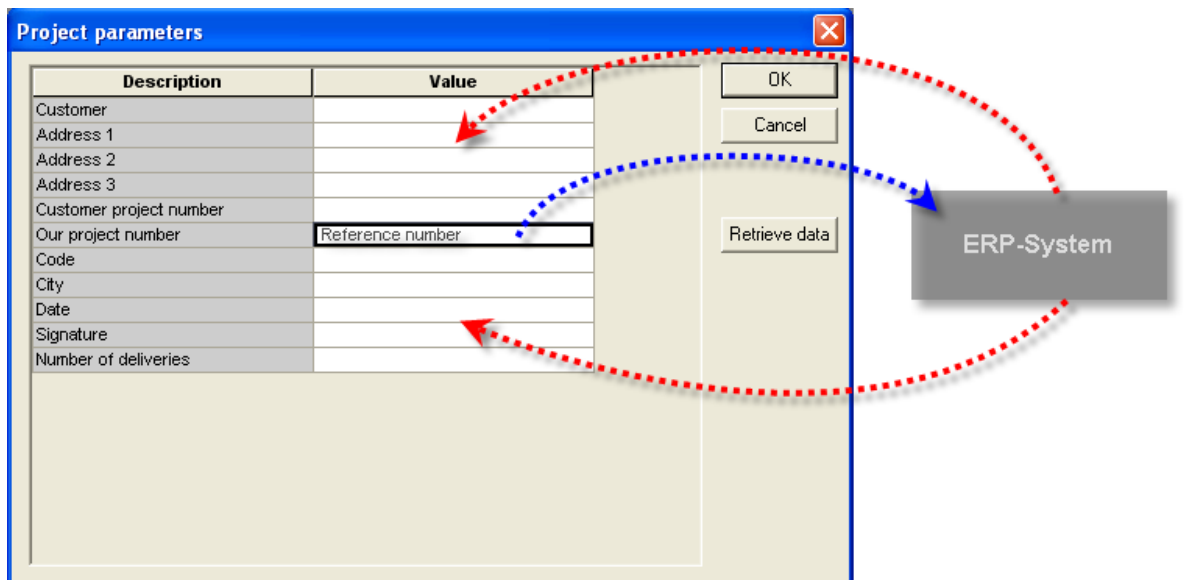

The input string is sent to the ERP-system with a Search Query, meaning StairCon[®] wants to import parameters that are connected to this input string in the ERP-system.

In StairCon® this is done by entering a value/reference number for “our project number” and pressing retrieve data.

Description	Value
Customer	
Address 1	
Address 2	
Address 3	
Customer project number	
Our project number	Reference number
Code	
City	
Date	
Signature	
Number of deliveries	

Buttons: OK, Cancel, Retrieve data

Parameters and place for output is specified in the configuration file. The output could for example be customer, address, code, city etc.

This saves time and the project information is sure to be the same in the ERP system and StairCon.
